

1      **ABSTRACT OF THE DISCLOSURE**

2            A tail pipe includes a hollow body, two external fittings and an optional  
3        illuminating assembly. The hollow body has an outer periphery on which each  
4        external fitting is mounted. Each external fitting has a side face that faces  
5        outward from the body and a protrusion formed with a given shape and  
6        extending from the side face. The illuminating assembly is mounted in the body  
7        and has two arms extended out of the body and having multiple illuminating  
8        members to illuminate the external fittings to be visible in a dark place.  
9            Therefore, the external fittings provide a decoration for the tail pipe to make that  
10       to look more attractive. Also, the external fittings provide a visible signal to alert  
11       someone who is near the tail pipe to keep a distance from the tail pipe to avoid  
12       getting burned by the hot tail pipe.
